

Better Training for Safer Food *Initiative*

**New technologies for a
better spray application
process**

**Precision farming to improve food
quality**

Contents

low-volume spraying, variable application rate, sensors
and other precision farming technologies

sensors for canopy characterization

new developments for drift reduction

Challenges regarding to spray application techniques

Productivity – optimization (Cost vs. Gain Approach)
Food quality (input management, market requirements, residues)
Safety (Operator, Environment, Equipment)
Information – Feedback (traceability)

Technologies providing potential answers

Dosage - Volume/ha adjustment
GNSS based solutions (traceability, guiding)
Canopy detection and adjustment
Drift management

Every crop production industry has unique specifications

GNSS based solutions (traceability, guiding)

Source: CA N-PdC

Global Positioning System
or GLONASS or GALILEO (2020)
24 satellites – 20 000 km
Precision ± 5 m

Time of flight based system
Localization by multilateration
4 satellites min.
Not usable alone for agricultural purposes

GNSS based solutions (traceability, guiding)

Source: CA N-PdC

dGPS : differential GPS

Corrections are provided by ref station(s) and correction signal is sent via GPRS or GSM

EGNOS, StarFire, Omnistar
Precision $\pm 5 - 50$ cm

Compatible with tractor guiding
Sensitive to forest and relief

GNSS based solutions (traceability, guiding)

Source: CA N-PdC

GPS RTK

Precision $\pm 2\text{cm}$

Use of Phase information
Ref stations – GSM
transmission

Used for precision works
(planting, sowing, hoeing)

GNSS based solutions (traceability, guiding)

Guiding assistance systems
Auto guiding systems (autopilot)

Gains ~5-10 %

Guiding solutions

Station météo & GPS

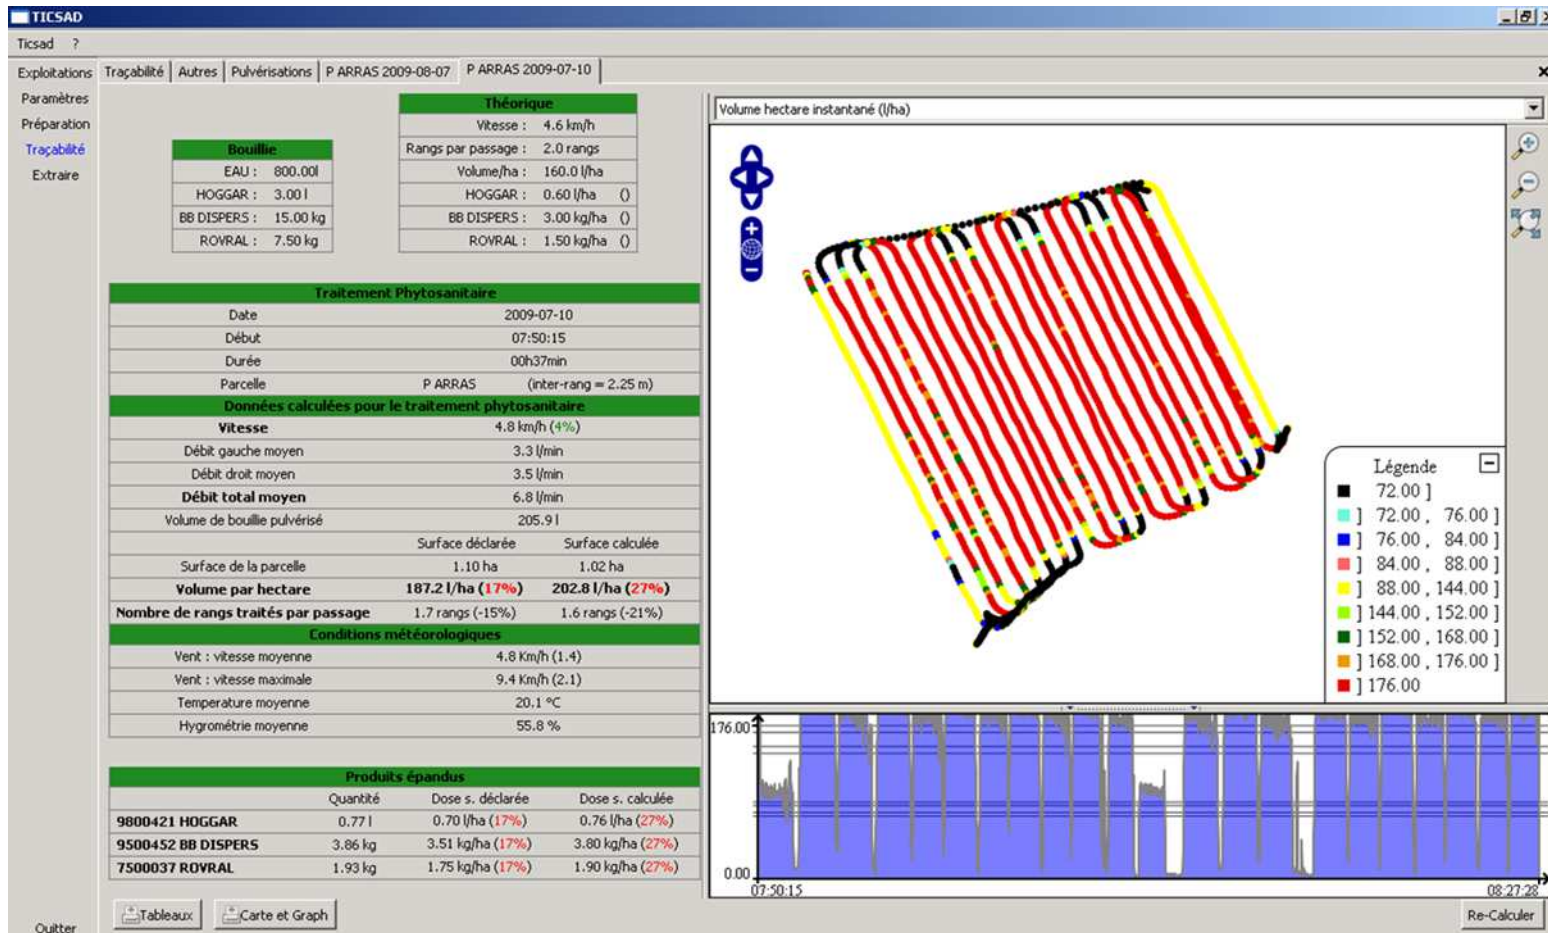

SITEVI 2009 – Laurent SCHEYER

13 / 23

Source IRSTEA

Results : Spray application mapping

Vegetation detection for site specific applications

How a *WeedSeeker*[®] sensor works

1. "Light emitting diodes" (LEDs) produce a combination of invisible infrared and visible red light which is projected onto the target approximately 600 mm below the sensor.

2. The light reflected from the target is captured by a detector at the front of the sensor.

3. Sophisticated electronic circuits inside the sensor analyze the reflected light and determine when it matches the light reflected by green plants.

4. When green plant's reflectance is identified, the sensor waits until the plant is under the spray nozzle and then triggers a fast-fire solenoid valve which sprays the plant.

Gains of Weed Mapping & Patch Spraying

Herbicide application is the best example
Savings up to 90 % (1, 2)

M Koller and W.T. Lanini, 2005. Site-specific herbicide applications based on weed maps provide effective control., *California Agriculture*, 59 (3). 182-187.

Hamouz et al., 2013. Impact of site-specific weed management on herbicide savings and winter wheat yield., *Plant Soil Env.*, 59 (3), 101-107

Main effect
S = Weed-seedling map
M = Mature-weed map
U = Uniform weed map

Secondary effect
 Zero rate (no herbicide applied)
 Medium rate (0.75 lb. a.i./acre)
 High rate (1.5 lbs, a.i./acre)

Biomass detection/measurement

11 Site-Specific Sensing for Fungicide Spraying

297

Fig. 11.1 Section control of a sprayer by ultrasonic sensing of biomass. The *insert* shows the sensing principle (From Reusch 2009 and Agri Con GmbH, Jahna, Germany, altered)

Precision in Crop Farming:
Site Specific Concepts and
Sensing Methods :
Applications and results.

Crop detection

Electronic measurements for canopy characterization

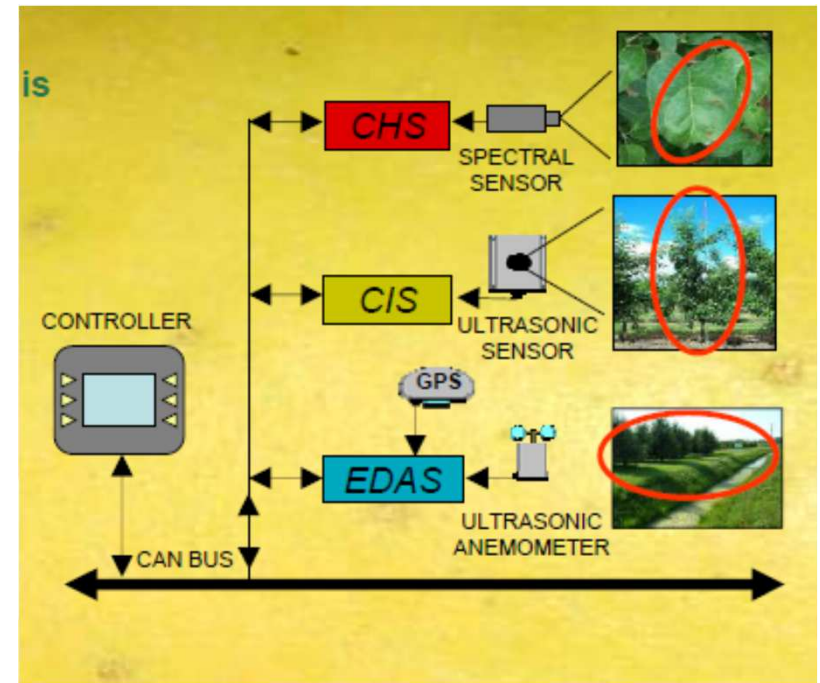

Detection of missing plants
Adjustment of the application rate

Gil, E.; Llorens, J.; Llop, J.; Fàbregas, X.; Gallart, M. Use of a terrestrial lidar sensor for drift detection in vineyard spraying. *Sensors* 2013, 13, 516–534.

Crop detection and targeted application sprayers

ISAFRUIT CASA

Crop detection systems :

Are used to detect missing vines or trees ?

May help to adapt the application volume to the crop volume ?

Can use ultrasonic sensors ?

Can use laser telemetry (Lidar) ?

Drift management (boom sprayers)

Air assisted boom sprayers

European database :
sdrt.-info.weebly.com

Drift management (boom sprayers)

Shielded nozzle sprayers

Drift management (boom sprayers)

Source wingsprayer

Boom deflectors

Drift management (bush and tree crop sprayers)

Conclusions

Current development of technologies to reduce the impact of pesticide application (dose adjustment, SSWM)

With the help of Precision Agriculture tools (GNSS, GIS) in order to keep a traceability of applications

Cost/gain approach is highly effective for weed management and gives promising results in the case of bush and tree crops applications
